

## ABSTRACT OF THE DISCLOSURE

In a network connecting a server and a plurality of user terminals, each of the user terminals transmits display style information to the server, the display style information specifying a display style of a file to be received from the server. The server receives the display style information from the user terminal and distributes a file of a display style in accordance with the display style information to the user terminals. Moreover, the server gives an identification number to each of the user terminals and holds display style information corresponding to each identification number. The server finds out display style information desired by the user terminal based on the identification number and distributes a file of the desired style to the user terminal. Otherwise, the user terminals store display style information and transmit the display style information to the server on an access to the server. On receiving the access from the user terminal, the server always distributes a file of a style in accordance with the display style information accompanied with the access to the user terminal.
